Hospital Management System

Our project is based on the idea of storing information of doctors, nurses,patients.In this we can add new entries of the respective workers and can get the stored information.

- ❖ Firstly the user has to login by using the password as Admin and userId is also Admin in order to get the information.
- ❖ And then if the userID and password is correct it will show the Main Menu.
- ❖ In the Main Menu it can choose whether it has to go to the Doctor database , patient database or the staff database.
- ❖ Then if the person goes to any of the above database then it has three options that is:-
  1. whether the person wants to see the info of all the doctors/patients/nurses.
  2. whether the person wants to see the info of a particular doctor/patients/nurses.
  3. whether the person wants to add the info.
